

Employee Attrition Analysis

Student Name: AttadaRavi Sankar

Dataset: WA_Fn-UseC_-HR-Employee-Attrition.csv

Project: Employee Attrition Analysis

Project Overview

Objective of the study was to find out the main causes for which employees are leaving the organization and how we can take some measures to retain the employees. This analysis was done using data regarding demographics, job, and work environment of the employees.

Data Preparation

The data related to employees was checked, cleaned, and prepared through validation of data quality, management of missing data, elimination of irrelevant data, and formatting the employees' data. This was done to ensure that the results were based on valid data.

Analysis Approach

The information about the employees was analyzed for comparison between employees who left and employees who did not leave. Some key factors such as department, position, compensation, work-life balance, travel requirements, overtime, and experience were studied to determine the causes of employee attrition. The next step is the predictive analysis for determining employees who are more likely to leave.

Key Findings

- It is also noted that around 16% of the employees quit the company, while 84% continued working, showing that the attrition rate impacts a lesser but significant part of the staff.
- In addition, the Sales Department had the highest attrition rate (20.63%), while the Human Resources Department ranked second (19.05%).
- By positions, Sales Representatives (39.76%) and Laboratory Technicians (23.94%) had the highest attrition rate among other employees.
- Overtime work, traveling, and no promotion for a longer period of time increased the chance of quitting the company.
- The employees who had a lower monthly income had higher chances of quitting, although salary was only one of the numerous factors affecting attrition rates.
- Moreover, most of the employees who left the company did it in the first two years after joining it.

Business Recommendations

- Give preference to retention programs for Sales Department employees such as Sales Representatives and Laboratory Technicians.
- Eliminate excessive overtime if possible and take special care of employees who travel on a regular basis for work.
- Hold career development meetings regularly and give promotions to employees who have been in the same job for a few years.
- Pay attention to onboarding, mentoring, and engagement programs during the first two years of employment of employees.

Conclusion

The above analysis shows that the issue of employee attrition is determined by not just the salary but also the job position, working environment, career development opportunities, and remuneration of employees. By concentrating on the high-risk employee segments and adopting the necessary retention policies, the organization will be able to minimize attrition and enhance employee satisfaction at low cost.
